InfoMetrix Program Moves Files From HP 9000 Series 300

MasterLink™, the newest software offering from InfoMetrix, is a file transfer and communication program specifically designed to move files from HP 9000 Series 300 Computers to virtually any other computer system. This transfer capability makes possible data processing and archival functions that are not now available in the HP environment.

Utilizing an intuitive pull-down menu system, the software requires almost no learning curve to operate. It transfers both ASCII and binary files, and can translate any text into readable form on the receiving computer.

MasterLink connects HP to HP, HP to IBM, or IBM to IBM. It supports color and monochrome on HP Pascal systems and translates IBM ASCII text to HP and vice-versa.

InfoMetrix is one of HP's value added businesses. The two companies work together to provide complete integration between computers and instruments in the analytical laboratory.

Founded in 1978, InfoMetrix is the leading developer of software products employing pattern recognition techniques for the analysis of multivariate data sets in chemistry and biotechnology. It markets general pattern recognition and applied pattern recognition software products internationally. The company's premier product, Quick-Res, performs self-modeling curve resolution to solve two-component separations problems for HPLC. InfoMetrix has also developed a series of chromatography enhancement products for file editing, data handling, and communications.

For more information, contact InfoMetrix, 2200 Sixth Avenue, Suite 833, Seattle, WA 98121. Phone: (206) 441-4696 Fax: (206) 441-0841.
